

OPA541 High Power Monolithic Operational Amplifier

1 Features

- Power Supplies to ± 40 V
- Output Current to 10-A Peak
- Programmable Current Limit
- Industry-Standard Pinout
- FET Input
- TO-3 and Low-Cost Power Plastic Packages

2 Applications

- Motor Drivers
- Servo Amplifiers
- Synchro Excitation
- Audio Amplifiers
- Programmable Power Supplies

3 Description

The OPA541 device is a power-operational amplifier capable of operation from power supplies up to ± 40 V, and delivering continuous output currents up to 5 A. Internal current-limit circuitry can be user-programmed with a single external resistor, protecting the amplifier and load from fault conditions. The OPA541 devices fabricated are using a proprietary bipolar and FET process.

The OPA541 uses a single current-limit resistor to set both the positive and negative current limits. Applications currently using hybrid power amplifiers requiring two current-limit resistors do need not to be modified.

The OPA541 is available in an 11-pin power plastic package and an industry-standard 8-pin TO-3 hermetic package. The power plastic package has a copper-lead frame to maximize heat transfer. The TO-3 package is isolated from all circuitry, allowing it to be mounted directly to a heat sink without special insulators.

Device Information⁽¹⁾

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Supply voltage, +V _S to –V _S			80	V
Output current		See SOA, Figure 11		
Power dissipation, Internal ⁽²⁾			125	W
Input voltage, differential			+V _S	
Input voltage, common-mode			+V _S	
Temperature, pin solder, 10 s			300	°C
Junction temperature ⁽²⁾			150	°C
Operating temperature (case)	AP	–40	85	°C
	AM, BM, SM	–55	125	
	AP	–25	85	
Storage temperature, T _{stg}	AM, BM, SM	–65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Long term operation at the maximum junction temperature will result in reduced product life. Derate internal power dissipation to achieve high MTTF.

6.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±250	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Supply Voltage (V ₊ – V _–)	10 (±5)	80 (±40)	V
Specified temperature	–40	125	°C

6.4 Thermal Information

7 Detailed Description

7.1 Overview

The OPA541 uses a JFET input stage, followed by a main voltage gain stage, and a class A/B high current output stage.

7.2 Functional Block Diagram

7.3 Feature Description

The OPA541 JFET input stage reduces circuit loading and input bias currents. The class A/B high current output stage incorporates temperature compensated biasing to reduce crossover distortion. The output stage also includes a user settable current limit for amplifier and circuit protection.

7.4 Device Functional Modes

The OPA541 has a single functional mode. The OPA541 is operational when the power supply voltage exceeds 10 V (± 5 V) and less than 80 V (± 40 V).

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The OPA541 is specified for operation from 8 V to 80 V (± 4 V to ± 40 V). Specifications apply over the -40°C to 85°C temperature range while the device operates from -40°C to 125°C . Parameters that can exhibit significant variance with regard to operating voltage or temperature are presented in [Typical Characteristics](#).

8.1.1 Current Limit

Internal current limit circuitry is controlled by a single external resistor, R_{CL} . Output load current flows through this external resistor. The current limit is activated when the voltage across this resistor is approximately a base-emitter turnon voltage. The value of the current limit resistor is calculated by [Equation 1](#).

$$\begin{aligned} \text{(AM, BM, SM)} \quad R_{CL} &= \frac{0.809}{|I_{LIM}|} - 0.057 \\ \text{(AP)} \quad R_{CL} &= \frac{0.813}{|I_{LIM}|} - 0.02 \end{aligned} \quad (1)$$

Because of the internal structure of the OPA541, the actual current limit depends on whether current is positive or negative. The above R_{CL} gives an average value. For a given R_{CL} , $+I_{OUT}$ will actually be limited at approximately 10% below the expected level, while $-I_{OUT}$ will be limited approximately 10% above the expected level.

The current limit value decreases with increasing temperature due to the temperature coefficient of a base-emitter junction voltage. Similarly, the current limit value increases at low temperatures. Current limit versus resistor value and temperature effects are shown in [Typical Characteristics](#). Approximate values for R_{CL} at other temperatures may be calculated by adjusting R_{CL} shown in [Equation 2](#).

$$\Delta R_{CL} = \frac{-2\text{mV}}{|I_{LIM}|} \times (T - 25) \quad (2)$$

The adjustable current limit can be set to provide protection from short circuits. The safe short-circuit current depends on power supply voltage. See the discussion on safe operating area in [Safe Operating Area](#) to determine the proper current limit value.

Because the full load current flows through R_{CL} , it must be selected for sufficient power dissipation. For a 5-A current limit on the TO-3 package, the formula yields an R_{CL} of 0.105 Ω (0.143 Ω on the power plastic package due to different internal resistances). A continuous 5 A through 0.105 Ω would require an R_{CL} that can dissipate 2.625 W.

Sinusoidal outputs create dissipation according to RMS load current. For the same R_{CL} , AC peaks would still be limited to 5 A, but RMS current would be 3.5 A, and a current-limiting resistor with a lower power rating could be used. Some applications (such as voice amplification) are assured of signals with much lower duty cycles, allowing a current resistor with a low power rating. Wire-wound resistors may be used for R_{CL} . Some wire-wound resistors, however, have excessive inductance and may cause loop-stability problems. Evaluate circuit performance with the resistor type planned for production to assure proper circuit operation.

8.1.2 Heat Sinking

Power amplifiers are rated by case temperature, not ambient temperature as with signal operational amplifiers. Sufficient heat sinking must be provided to keep the case temperature within rated limits for the maximum ambient temperature and power dissipation. The thermal resistance of the heat sink required may be calculated by [Equation 3](#).

Application Information (continued)

$$\theta_{HS} = \frac{T_{CASE} - T_{AMBIENT}}{P_D (max)} \quad (3)$$

Commercially available heat sinks often specify their thermal resistance. These ratings are often suspect, however, because they depend greatly on the mounting environment and air flow conditions. Actual thermal performance should be verified by measuring the case temperature under the required load and environmental conditions.

No insulating hardware is required when using the TO-3 package. Because mica and other similar insulators typically add approximately 0.7°C/W thermal resistance, their elimination significantly improves thermal performance. See [Related Documentation](#) for further details on heat sinking. On the power plastic package, the metal tab may have a high or low impedance connection to $-V_S$. The case must be allowed to float, and likely assumes the potential of $-V_S$. Current must not be conducted through the case.

8.1.3 Safe Operating Area

The safe operating area (SOA) plot provides comprehensive information on the power-handling abilities of the OPA541. The SOA shows the allowable output current as a function of the voltage across the conducting output transistor (see [Figure 11](#)). This voltage is equal to the power supply voltage minus the output voltage. For example, as the amplifier output swings near the positive power supply voltage, the voltage across the output transistor decreases and the device can safely provide large output currents demanded by the load. Short circuit protection requires evaluation of the SOA. When the amplifier output is shorted to ground, the full power supply voltage is impressed across the conducting output transistor. The current limit must be set to a value which is safe for the power supply voltage used. For instance, with $V_S \pm 35$ V, a short to ground would force 35 V across the conducting power transistor. A current limit of 1.8 A would be safe.

Figure 11. Safe Operating Area

Reactive or EMF-generating loads such as DC motors can present difficult SOA requirements. With a purely reactive load, output voltage and load current are 90° out of phase. Thus, peak output current occurs when the output voltage is zero and the voltage across the conducting transistor is equal to the full power supply voltage. See [Related Documentation](#) for further information on evaluating SOA.

8.1.4 Replacing Hybrid Power Amplifiers

The OPA541 can be used in applications currently using various hybrid power amplifiers, including the OPA501, OPA511, OPA512, and 3573. Of course, the application must be evaluated to assure that the output capability and other performance attributes of the OPA541 meet the necessary requirements. These hybrid power amplifiers use two current limit resistors to independently set the positive and negative current limit value. Because the OPA541 uses only one current limit resistor to set both the positive and negative current limit, only one resistor such as [Figure 12](#) need be installed. If installed, the resistor connected to pin 2 (TO-3 package) is superfluous, but it does no harm.

Application Information (continued)

Figure 12. Isolating Capacitive Loads

Because one resistor carries the current previously carried by two, the resistor may require a high power rating. Minor adjustments may be required in the resistor value to achieve the same current limit value. Often, however, the change in current limit value when changing models is small compared to its variation over temperature. Many applications can use the same current limit resistor.

8.2 Typical Applications

8.2.1 Clamping Output for EMF-Generating Loads

Figure 13. Clamping Output for EMF-Generating Loads

8.2.1.1 Design Requirements

- Motor drive with reversal requiring output clamping
- 20-V motor
- 1-Ω DC resistance
- 10-µH inductance
- 40°C maximum ambient temperature

8.2.1.2 Detailed Design Procedure

8.2.1.2.1 Power Supply Requirements

Select the power supply based on the requirement to achieve a ± 20 -V output with up to a 5-A load. The maximum value for output voltage swing at 5-A is approximately within 4 V of either rail and ± 25 . These supplies provide sufficient output swing.

8.2.1.2.2 Current Limit and SOA (Safe Operating Area)

Set the current limit to the highest possible value for the application which generally corresponds to a short circuit on the output. In this application this corresponds to 25-V stress on the output device and examination of the SOA (Safe Operating Area) graph in [Figure 11](#) indicates that a 5-A current limit is within the 25°C SOA.

Typical Applications (continued)

8.2.1.2.3 Heat Sinking

Short circuit conditions at 5 A and 25 V must support 125 W of dissipation up to the 40°C ambient requirements of the application. This indicates the need for a heatsink with a $R_{\theta HA} < 0.68^{\circ}\text{C/W}$, such as an Waekfield-Vette 345 series.

8.2.1.3 Application Curve

The scope trace in [Figure 14](#) depicts a motor reversal of a 20-V motor being driven by an OPA541 powered by ± 25 V. This motor has 1 Ω of DC resistance and 10 μH of inductance.

NOTE

At the beginning of the reversal the motor inductance results in an overshoot up to the supply rail. This overshoot is clamped by the external fast recovery diodes. While the current shown exceeds the 5-A current limit, this current is actually flowing in the flyback diodes.

Figure 14. Transient Response

8.2.2 Paralleled Operation, Extended SOA

Parallel operation is often used to increase output current or wattage. However, due to their low output impedance, power operational amplifiers cannot be connected in parallel without modifying the circuits. [Figure 15](#) shows one method of doing this. The upper amplifier is a master, configured as required to satisfy the circuit function, has a small sense resistor inside its feedback loop. The slave amplifier is a unity gain buffer. Thus, the output voltages of the two amplifiers are equal. If the two sense resistors connected to the load are equal, the amplifiers share current equally. More slaves may be added as desired. The additional resistor and capacitor on the slave enhance stability.

Typical Applications (continued)

Figure 15. Paralleled Operation, Extended SOA

8.2.2.1 Design Requirements

Design requirements for the parallel connection in Figure 15 are shown here. The maximum current available from a single OPA541 cannot exceed 10 A:

- Gain from input to output of -10
- Current capability of > 15 A
- Short to ground on ± 15 -V supply rails at 25°C case temperature

8.2.3 Programmable Voltage Source

The programmable voltage source of Figure 16 uses the OPA541 as a current-to-voltage converter for a current output DAC (digital-to-analog converter). The diodes clamp any differential input voltages to safe levels for the OPA541. The OPA541 provides the gain to produce the desired output.

Figure 16. Programmable Voltage Source

8.2.3.1 Design Requirements

Design requirements for Figure 16:

- Convert 0 to -2 -mA current input to 0-V to 50-V output voltage
- Current capability of > 2.5 A
- Protection of current output DAC during fast slew

9 Power Supply Recommendations

The OPA541 is specified for operation from power supplies up to ± 40 V. The OPA541 can also be operated from unbalanced power supplies or a single power supply, as long as the total power supply voltage does not exceed 80 V. The power supplies should be bypassed with low series-impedance capacitors such as ceramic or tantalum. These must be located as near as practical to the power supply pins of the amplifier. Good power amplifier circuit layout is, in general, similar to good high-frequency layout: consider the path of the large power supply and output currents and avoid routing these connections near low-level input circuitry to avoid waveform distortion and oscillations.

10 Layout

10.1 Layout Guidelines

Figure 18 provides the recommended solder footprint for the TO-220 power package. The tab is electrically connected to the negative supply, V_- . It may be desirable to isolate the tab of the TO-220 package from its mounting surface with a mica (or other film) insulator. For lowest overall thermal resistance, it is best to isolate the entire heat sink or OPA541 structure from the mounting surface rather than to use an insulator between the semiconductor and heat sink.

10.2 Layout Example

Figure 18. Recommended Layout

OPA541SM	NRND	TO-3	LMF	8	18	Pb-Free (RoHS Exempt)	NI	N / A for Pkg Type		OPA541 OPA541SM	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated (TI) reserves the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete.

TI's published terms of sale for semiconductor products (<http://www.ti.com/sc/docs/stdterms.htm>) apply to the sale of packaged integrated circuit products that TI has qualified and released to market. Additional terms may apply to the use or sale of other types of TI products and services.

Reproduction of significant portions of TI information in TI data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such reproduced documentation. Information of third parties may be subject to additional restrictions. Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyers and others who are developing systems that incorporate TI products (collectively, "Designers") understand and agree that Designers remain responsible for using their independent analysis, evaluation and judgment in designing their applications and that Designers have full and exclusive responsibility to assure the safety of Designers' applications and compliance of their applications (and of all TI products used in or for Designers' applications) with all applicable regulations, laws and other applicable requirements. Designer represents that, with respect to their applications, Designer has all the necessary expertise to create and implement safeguards that (1) anticipate dangerous consequences of failures, (2) monitor failures and their consequences, and (3) lessen the likelihood of failures that might cause harm and take appropriate actions. Designer agrees that prior to using or distributing any applications that include TI products, Designer will thoroughly test such applications and the functionality of such TI products as used in such applications.

TI's provision of technical, application or other design advice, quality characterization, reliability data or other services or information, including, but not limited to, reference designs and materials relating to evaluation modules, (collectively, "TI Resources") are intended to assist designers who are developing applications that incorporate TI products; by downloading, accessing or using TI Resources in any way, Designer (individually or, if Designer is acting on behalf of a company, Designer's company) agrees to use any particular TI Resource solely for this purpose and subject to the terms of this Notice.

TI's provision of TI Resources does not expand or otherwise alter TI's applicable published warranties or warranty disclaimers for TI products, and no additional obligations or liabilities arise from TI providing such TI Resources. TI reserves the right to make corrections, enhancements, improvements and other changes to its TI Resources. TI has not conducted any testing other than that specifically described in the published documentation for a particular TI Resource.

Designer is authorized to use, copy and modify any individual TI Resource only in connection with the development of applications that include the TI product(s) identified in such TI Resource. NO OTHER LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE TO ANY OTHER TI INTELLECTUAL PROPERTY RIGHT, AND NO LICENSE TO ANY TECHNOLOGY OR INTELLECTUAL PROPERTY RIGHT OF TI OR ANY THIRD PARTY IS GRANTED HEREIN, including but not limited to any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information regarding or referencing third-party products or services does not constitute a license to use such products or services, or a warranty or endorsement thereof. Use of TI Resources may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

TI RESOURCES ARE PROVIDED "AS IS" AND WITH ALL FAULTS. TI DISCLAIMS ALL OTHER WARRANTIES OR REPRESENTATIONS, EXPRESS OR IMPLIED, REGARDING RESOURCES OR USE THEREOF, INCLUDING BUT NOT LIMITED TO ACCURACY OR COMPLETENESS, TITLE, ANY EPIDEMIC FAILURE WARRANTY AND ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, AND NON-INFRINGEMENT OF ANY THIRD PARTY INTELLECTUAL PROPERTY RIGHTS. TI SHALL NOT BE LIABLE FOR AND SHALL NOT DEFEND OR INDEMNIFY DESIGNER AGAINST ANY CLAIM, INCLUDING BUT NOT LIMITED TO ANY INFRINGEMENT CLAIM THAT RELATES TO OR IS BASED ON ANY COMBINATION OF PRODUCTS EVEN IF DESCRIBED IN TI RESOURCES OR OTHERWISE. IN NO EVENT SHALL TI BE LIABLE FOR ANY ACTUAL, DIRECT, SPECIAL, COLLATERAL, INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL OR EXEMPLARY DAMAGES IN CONNECTION WITH OR ARISING OUT OF TI RESOURCES OR USE THEREOF, AND REGARDLESS OF WHETHER TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Unless TI has explicitly designated an individual product as meeting the requirements of a particular industry standard (e.g., ISO/TS 16949 and ISO 26262), TI is not responsible for any failure to meet such industry standard requirements.

Where TI specifically promotes products as facilitating functional safety or as compliant with industry functional safety standards, such products are intended to help enable customers to design and create their own applications that meet applicable functional safety standards and requirements. Using products in an application does not by itself establish any safety features in the application. Designers must ensure compliance with safety-related requirements and standards applicable to their applications. Designer may not use any TI products in life-critical medical equipment unless authorized officers of the parties have executed a special contract specifically governing such use. Life-critical medical equipment is medical equipment where failure of such equipment would cause serious bodily injury or death (e.g., life support, pacemakers, defibrillators, heart pumps, neurostimulators, and implantables). Such equipment includes, without limitation, all medical devices identified by the U.S. Food and Drug Administration as Class III devices and equivalent classifications outside the U.S.

TI may expressly designate certain products as completing a particular qualification (e.g., Q100, Military Grade, or Enhanced Product). Designers agree that it has the necessary expertise to select the product with the appropriate qualification designation for their applications and that proper product selection is at Designers' own risk. Designers are solely responsible for compliance with all legal and regulatory requirements in connection with such selection.

Designer will fully indemnify TI and its representatives against any damages, costs, losses, and/or liabilities arising out of Designer's non-compliance with the terms and provisions of this Notice.
